Maxwell's Equations:

$$\vec{\nabla} \times \vec{E}_i = -j\omega\mu_0\vec{H}_i,$$

$$\vec{\nabla} \times \vec{H}_i = +j\omega\epsilon_0 n_i^2 \vec{E}_i, \quad i = 1, 2$$

Helmholtz's Equation:

$$\nabla^2 \vec{E}_i + k_0^2 n_i^2 \vec{E}_i = 0, \quad (i = 1, 2)$$

$$\vec{E}_i = \vec{E}_{ti} + E_{zi}\hat{z} = [E_{ri}\hat{r} + E_{\phi i}\hat{\phi}] + E_{zi}\hat{z}, \quad (i = 1, 2)$$

## Power Considerations (LP Modes)

The Poynting vector along the z-direction is given by: (for a mode)

$$S_z = \frac{1}{2} \operatorname{Re} \{ \vec{E} \times \vec{H}^* \}_z = \frac{1}{2} \operatorname{Re} \{ E_x H_y^* - E_y H_x^* \} = \frac{1}{2} \operatorname{Re} \{ E_r H_\phi^* - E_\phi H_r^* \}$$

Then the power in the core and cladding can be found from:

$$P_{\text{core}} = \int_{\phi=0}^{2\pi} \int_{r=0}^a S_z r dr d\phi$$

$$P_{\text{clad}} = \int_{\phi=0}^{2\pi} \int_{r=a}^{\infty} S_z r dr d\phi$$

For  $LP_{\nu m}$  modes (weakly guiding approximation) it can be shown that

$$P_{\text{core}} = \frac{\beta_\nu}{2\omega\mu_0} \pi a^2 |A_1|^2 [J_\nu^2(\kappa a) - J_{\nu-1}(\kappa a) J_{\nu+1}(\kappa a)]$$

$$P_{\text{clad}} = \frac{\beta_\nu}{2\omega\mu_0} \pi a^2 |A_1|^2 \left[ -J_\nu^2(\gamma a) - \left(\frac{\gamma}{\delta}\right)^2 J_{\nu-1}(\gamma a) J_{\nu+1}(\gamma a) \right]$$

$$P = P_{\text{clad}} + P_{\text{core}} = \frac{\beta_\nu}{2\omega\mu_0} \pi a^2 |A_1|^2 \left( 1 + \left(\frac{\gamma}{\delta}\right)^2 \right) (-J_{\nu-1}(\gamma a) J_{\nu+1}(\gamma a))$$

## Power Considerations (LP Modes)

$$\Gamma_{cl} = \frac{P_{clad}}{P} = \frac{1}{V^2} \left[ (ka)^2 + \frac{(ga)^2 J_\nu^2(ka)}{J_{\nu-1}(ka) J_{\nu+1}(ka)} \right] = \left( \frac{ka}{V} \right)^2 \left( 1 - \frac{K_\nu^2(ga)}{K_{\nu-1}(ga) K_{\nu+1}(ga)} \right)$$

$$\Gamma_{co} = \frac{P_{core}}{P} = 1 - \Gamma_{cl} = 1 - \left( \frac{ka}{V} \right)^2 \left[ 1 - \frac{K_\nu^2(ga)}{K_{\nu-1}(ga) K_{\nu+1}(ga)} \right]$$
